

# Harvest Moon Trail

The **Annapolis Valley Trails Coalition** require a multiuser geographic information system to be implemented, merging disparate data sources pertaining to all aspects of their operation.

Using the GIS solution, stakeholders will be given the ability to effectively **store, view, query, and manipulate spatial and tabular data in an enterprise environment**. This will ultimately result in the provision of a **flexible, scalable framework able to accommodate ongoing business developments**. Furthermore, the efficiency of the AVTC's day-to-day operations will be increased, and the ability to share data will be simplified.

The diagram below illustrates the proposed design, showing all data to be included and how relationships between these will exist in a PostgreSQL database.
